

We've narrowed it down pretty well.

Where you are now

What is **working**:

- Docker app is healthy
- Ollama direct call from the app container works
- Local /api/chat works for:
 - hi
 - مرحبا
 - أريد سيارة مرسيدس موديل 2019

What is **still unstable**:

- Public <https://chatsoq.com/api/chat> is intermittent
- App logs still show:
 - Invalid state: Controller is already closed

So this is **no longer an infrastructure problem**. It's now a mix of:

1. a **route stream cleanup bug** in `src/app/api/chat/route.ts`
2. possibly **proxy buffering / SSE behavior** on the public domain path

What your latest evidence says

The key evidence is:

- direct Ollama call works
- local app call works
- public call only sometimes stalls
- logs show:
 - [CHAT] direct text path hit: ...
 - then Invalid state: Controller is already closed

That means the app is **reaching the direct path**, but the stream lifecycle is still not fully clean.

Next thing to do

1) Inspect the reverse proxy config

Run:

```
cd /mnt/c/inetpub/monetchat
sed -n '1,220p' web.config
```

This will tell us whether IIS is likely buffering SSE.

2) Inspect the exact direct-path block and catch block again

Run:

```
sed -n '150,230p' src/app/api/chat/route.ts
sed -n '580,620p' src/app/api/chat/route.ts
```

I want to confirm whether the direct path still calls `controller.close()` and then later falls into code paths that can still throw.

3) One clean local verification

Run:

```
curl -N -X POST http://127.0.0.1:3000/api/chat \
-H "Content-Type: application/json" \
-d '{"message": "أريد سيارة مرسيدس موديل 2019"}'
```

If local still works while public stalls, then the public issue is almost certainly proxy/SSE buffering.

My current read

Right now, the most likely final cleanup is:

- **app fix:** make the direct-text path exit without any later chance of writing to the controller
- **proxy fix:** if IIS is in front, disable buffering for SSE responses

Your SSH timeout from the Mac in Terminal 1 is separate. That was just the SSH session dropping, not the app failing.

Paste web.config and those two route.ts sections, and I'll give you the exact next patch.
