

sellsell marketplace updates - 09052026

UPDATE: 09/05/2026:05:40AM

SHAZ EJ

Today's Task Plan — SellSell Marketplace + AI Moderation

1. Landing Page → Marketplace CTA

- Add:
 - “Browse Marketplace”
 - “استكشف السوق”
- Link to:
 - /explore
- Keep existing AI/chat CTA.

2. Marketplace Frontend Validation

Verify existing marketplace works correctly:

- /explore
- category pages
- product pages
- filters
- pagination
- mobile responsiveness

Fix obvious UI/runtime issues only.

3. Seller Listing Flow Cleanup

Current goal:

- seller should immediately see structured listing form
- no long AI interview/chat flow

Fields:

- images
- title
- category
- price
- location
- description
- phone number

4. AI Listing Understanding Layer

When seller uploads image/details:

- Ollama identifies:
 - product type
 - suggested category
 - title
 - condition
 - attributes/specs
- AI fills missing fields automatically.

5. AI Validation System

Implement validation logic:

AI checks:

- image matches category
- item quality acceptable
- prohibited/spam content
- fake/placeholder images
- missing critical data

Result:

- confidence score
- moderation status

6. Moderation Workflow (Hybrid AI + Human)

Add moderation states:

```
draft
pending_review
approved
rejected
auto_approved
```

Workflow:

- AI high confidence → auto approve + visible to moderators
- AI low confidence → pending moderator review

- moderators can override AI decisions
-

7. Moderator Dashboard Planning

Prepare moderation backend structure:

- review queue
- AI confidence display
- approve/reject
- edit listing
- remove listing
- flag suspicious sellers

(No full implementation today unless time allows.)

8. Search + Marketplace Direction

Keep BOTH systems:

Traditional Marketplace

- browse listings
- filters
- categories
- product pages

AI Discovery

- text chat
- image search
- voice search
- semantic search

AI enhances marketplace, not replaces it.

9. Database/Schema Review Before Changes

Before adding moderation:

- inspect current Prisma models
- identify safest schema extension path
- avoid destructive migrations

10. End-to-End Browser Testing

Test complete flows:

- seller listing
 - image upload
 - AI extraction
 - publish
 - marketplace visibility
 - buyer browsing
 - moderation visibility
-

11. Final Cleanup

- remove dead seller flow logic
 - reduce duplicated marketplace components
 - fix branding leftovers
 - stabilize Docker/dev workflow
-

Priority Order for Today

Highest Priority

1. Landing page marketplace CTA
2. Seller structured listing flow
3. Marketplace validation
4. AI listing understanding

Medium Priority

5. Moderation architecture
6. AI validation confidence system

Lower Priority

7. Moderator dashboard UI
8. Cleanup/refactor work

1. Landing Page → Marketplace CTA

Add a new CTA button on the SellSell landing page hero section called:

- English: Browse Marketplace
- Arabic: استكشف السوق

Link it to:

/explore

Keep the existing AI/chat button unchanged.

Do not redesign the page.

2. Marketplace Frontend Validation

Audit and test the marketplace frontend routes:

/explore

/category/[slug]

/product/[productName]

Fix broken UI, API, pagination, filter, image, or mobile responsiveness issues only.

Do not redesign the marketplace.

3. Seller Listing Flow Cleanup

Replace the conversational seller flow with a direct listing form inside chat.

When seller says "I want to sell":

Immediately show a structured listing card with:

- image upload
- title
- category
- price
- location
- description
- phone number

Avoid long AI questioning flow.

4. AI Listing Understanding Layer

Improve AI extraction for seller listings.

When seller uploads an image or description:

Use Ollama to automatically detect:

- product title
- category
- condition
- specs/attributes
- suggested description

User-entered fields must always override AI-generated values.

5. AI Validation System

Implement AI validation before publishing listings.

AI should check:

- image/category match
- spam/fake listings
- prohibited content
- placeholder images
- missing critical details

Return:

- validation status
 - confidence score
 - moderation recommendation
-

6. Hybrid AI + Human Moderation

Implement moderation workflow for listings.

Add statuses:

- draft
- pending_review
- auto_approved
- approved
- rejected

High-confidence AI listings can auto-publish.

Moderators must still see and override all approvals/rejections.

7. Moderator Dashboard Planning

Create the backend structure and initial UI plan for moderator dashboard.

Features:

- listing review queue
- AI confidence display
- approve/reject
- edit listing
- seller flagging

Do not fully build advanced analytics yet.

8. Marketplace + AI Search Direction

Preserve both systems:

1. Traditional marketplace browsing
2. AI-powered search/chat experience

Do not replace marketplace with chat.

AI should enhance marketplace discovery and listing quality.

9. Prisma/Database Review

Audit Prisma schema before moderation changes.

Identify safest non-destructive approach for:

- moderation status
- AI confidence
- validation metadata

Avoid risky migrations or breaking existing auth/listing flows.

10. End-to-End Browser Testing

Perform full browser testing for:

- seller listing creation
- image upload
- AI extraction
- publish flow
- marketplace visibility
- buyer browsing
- moderation visibility

Document failures clearly before making fixes.

11. Cleanup & Stabilization

Clean up duplicated marketplace logic and unstable seller flow code.

Remove:

- dead components
- unused seller AI flow
- duplicate marketplace cards

Stabilize Docker/dev environment without changing production behavior.

I went through Dubizzle Kuwait carefully — both the UI patterns and how their marketplace workflow is structured.

Your current direction for Sell-Sell is actually stronger long-term because you're combining:

- traditional marketplace browsing (Dubizzle style)
- AI-assisted publishing
- AI-assisted search
- moderation intelligence

Dubizzle is mostly a classic classifieds platform. Your system can become a next-gen AI marketplace layered on top of that same familiar UX.

Here's the important product understanding from studying Dubizzle:

What Dubizzle Does Very Well

1. Simple Marketplace First

The user immediately understands:

- browse
- search
- category
- post ad

No confusion.

This is important.

Your `/explore` page is already moving in this direction.

2. Strong Category Hierarchy

Dubizzle is category-first:

Properties
Cars
Electronics
Mobiles
Fashion
Jobs
Services

Then subcategories.

Your AI should NOT replace categories.
AI should HELP select categories.

That matches Fahad's architecture diagram perfectly.

3. Listing Cards Are the Core Product

Dubizzle focuses heavily on:

- image
- price
- title
- location
- timestamp

Very little distraction.

Your current cards still need:

- real images
 - cleaner spacing
 - stronger card hierarchy
 - condition/location polish
-

4. Search Is the Main Entry Point

Dubizzle uses:

- large search bar
- location selector
- category browsing

Your system should evolve into:

Normal Search
+
AI Search
+
Voice Search
+
Image Search

Exactly like Fahad's diagram.

5. Posting Flow Is Structured

Dubizzle does NOT use conversational publishing.

They use:

- category selection
- structured form
- image upload
- preview
- publish

This confirms your new direction:

The seller flow should become a proper structured listing flow, not long chat conversations.

Good decision.

6. Moderation Exists Everywhere

Dubizzle clearly has:

- pending review
- rejected ads
- prohibited categories
- moderation rules
- safety enforcement

Your AI moderation layer should enhance this — not replace it.

Exactly what you described:

- AI auto-validates
- moderators still oversee

That is the correct architecture.

What Sell-Sell Should Become

You should position Sell-Sell as:

Dubizzle + AI Layer

NOT:

That distinction is extremely important.

Recommended Product Structure

Homepage

Marketing + AI + Marketplace CTA

Marketplace Explore

Traditional marketplace browsing

Like Dubizzle:

- categories
 - filters
 - cards
 - locations
 - product pages
-

AI Search

Enhanced search:

- text
 - voice
 - image
 - semantic understanding
-

Seller Publishing

Structured form:

- AI autofill
- AI category detection
- AI moderation
- moderator review

Moderator Dashboard

Human oversight:

- AI confidence
 - approval queue
 - fraud review
 - category correction
-

Biggest Insight From Dubizzle

The marketplace itself must feel:

- simple
- familiar
- trusted
- fast

AI should feel like:

- enhancement
- automation
- intelligence layer

Not like the entire product is a chatbot.

That's the biggest product takeaway from this review.

Viewed Dockerfile.backup:1-15

Ran command: `find . -name "AGENTS.md"`

Viewed AGENTS.md:1-110

****Phase 1: Before writing any code****

1. Files to inspect: None (This is a pure browser-testing task for the production URL).
2. Confirming no duplication: N/A.

3. Intended change: Run a browser test on `https://sell-sell.com` across 9 key areas (Landing, Explore, Product, Categories, Auth, Chat, Seller Flow, Arabic, Mobile) without making any code changes.

4. Classification: ****SAFE**** (Testing only).

Pre-Action Checklist

- [x] I have searched the codebase for existing implementations.
- [x] I am not duplicating existing logic or components.
- [x] I am not modifying the Prisma schema without explicit approval.
- [x] I am not introducing a new AI provider (sticking to local Ollama on port 11434).
- [x] I am using the existing architecture and patterns.

I will now start a browser subagent to execute this test plan and record the session.

Browser task: "Testing Production Site sell-sell.com"

Ran command: `mkdir -p /Users/shazej/.gemini/antigravity/brain/3c8b02c6-e4cc-494f-b142-239861e36d79/artifacts && cp /Users/shazej/.gemini/antigravity/brain/3c8b02c6-e4cc-494f-b142-239861e36d79/.system_generated/click_feedback/*.png /Users/shazej/.gemini/antigravity/brain/3c8b02c6-e4cc-494f-b142-239861e36d79/artifacts/`

Edited production_browser_test_report.md

I have completed the browser testing of the production site (`https://sell-sell.com`) strictly following your instructions.

The test results, including the PASS/FAIL breakdown, route analysis, and the required screenshots, have been compiled into a comprehensive report in the `production\_browser\_test\_report.md` artifact.

Here is the high-level summary:

- ****Browsing & Shopping Flows (PASS):**** The landing page, explore route, categories, sorting, and product detail pages load properly without errors.
- ****Authentication (PASS):**** Login and signup forms render correctly and sessions initiate smoothly.
- ****Selling Flow (FAIL):**** We found a blocker in the Seller Profile flow. When trying to save profile data (Name/Phone), a `403 Forbidden` error occurs, completely preventing users from successfully creating new product listings.

Please review the attached artifact for the detailed screenshots, observed issues (like image proxy errors and AI latency), and recommended paths for remediation.

Post-Action Checklist

- [x] Files changed have been explicitly listed: None (Testing task only, no code was modified).
- [x] Commands run (lint, typecheck, tests) have been listed: `browser\_subagent` was run against `https://sell-sell.com` without touching local Docker configurations.
- [x] Confirmation that no system rules were violated: Confirmed. No destructive changes, commits, or schema modifications were made.
