

sellsell marketplace updates - 20042026

UPDATE: 20/04/2026:08:06PM

SHAZ EJ

Good move. Before building anything else, you need a **clear map of what your backend actually does right now**.

I'll structure it cleanly so you (and Fahad) can see everything in one view.

FULL BACKEND FUNCTIONALITY (CURRENT STATE)

1. Authentication System

✓ Firebase Phone OTP (Primary)

- User enters phone
- Firebase sends OTP
- Frontend verifies OTP
- Backend verifies `idToken`
- Creates or finds user
- Issues:
 - Access token (JWT)
 - Refresh token (DB-backed)
- Sets secure cookies

This is your **main login system**

✓ Email + Password (Secondary)

- `/api/auth/login`
- `/api/auth/register`
- Password hashing with `bcrypt`
- JWT session creation

Mostly for admin / fallback

✓ Session System

- Access token (short-lived)
- Refresh token (stored in DB)

- /api/auth/refresh
- /api/auth/logout
- Cookie-based auth

👉 Production-grade session model

✅ Identity Handling

- Users identified by:
 - phone OR email
 - New **identity resolver**
 - prevents duplicate users
 - removes placeholder email issue
-

2. User System

- User model (Prisma)
 - Roles (admin, user, etc.)
 - Country association
 - Fields:
 - tokenBalance
 - totalInvested
 - kycStatus
-

3. Audit & Logging

- AuditLog system
 - Tracks:
 - login
 - actions
 - Standardized method:
 - password
 - firebase_phone
 - refresh
-

4. Security Layer

✅ Rate Limiting

- Middleware-based
- Strict on:
 - all `/api/auth/*` routes

✓ Env Validation

- No more fallback secrets
- `JWT_SECRET` must exist

✓ Secure Cookies

- `httpOnly`
- `secure` (prod)
- `sameSite` control

🔥 5. Firebase Integration

- Firebase Admin (backend)
- Firebase Client (frontend)
- Phone OTP verification
- Token validation

👉 This is your **identity provider**

🧱 6. Core Infrastructure

✓ Prisma (Database Layer)

- PostgreSQL
- Models:
 - User
 - Role
 - RefreshToken
 - AuditLog
 - Country

✓ Redis

- Available
- Previously used for OTP

- Now free for:
 - caching
 - rate limiting
 - sessions (future)
-

Email System (Brevo)

- Transactional emails
 - Password reset ready
-

7. PropertyNir (NEWLY ADDED)

⚠ This is a **separate system inside your backend**

Models:

- TokenizedProperty
 - Investment
 - Transaction
 - InterestLog
 - KycData
 - PaymentGateway
-

APIs:

/api/propertynir/properties

- GET → list properties
 - POST → create property (admin)
-

/api/propertynir/invest

- Handles investment flow
 - Uses Prisma transaction
 - Checks:
 - available tokens
 - KYC approved
 - user balance
-

Logic:

- fractional ownership
 - token system
 - investment tracking
 - financial ledger behavior
-

👉 This is **NOT marketplace logic**

👉 This is **investment engine**

8. What Was REMOVED

- Redis OTP system
- SMS provider system
- OTP API routes
- OTP env variables
- OTP schemas

👉 Cleaned successfully

FINAL ARCHITECTURE (WHAT YOU NOW HAVE)

You currently have **2 systems inside one backend**:

System A — Clean Auth + Core Backend (GOOD)

- Firebase login
- JWT sessions
- user system
- audit logs
- rate limiting
- prisma base

👉 This is your **real foundation**

System B — PropertyNir Investment Engine

- tokenized properties
- investments
- KYC
- wallet logic
- transactions

👉 This is a **different product layer**

IMPORTANT REALIZATION

You are now at a **fork**:

Option 1 (Recommended)

- 👉 Keep System A
- 👉 Ignore / isolate System B
- 👉 Build:

- listings
 - search
 - chat AI marketplace
-

Option 2

- 👉 Build investment + marketplace hybrid (complex, risky)
-

Option 3

- 👉 Split into 2 separate products
-

How to explain to Fahad (short)

Send this:

Right now backend has two parts — a clean auth/core system, and a separate investment engine (PropertyNir).

The core system is solid and ready for building the AI marketplace.

The PropertyNir part is a different direction (investment model), so we need to decide if we keep it separate or not.

What's MISSING (for your actual product)

For SellSell / PickPic you still need:

- Listings system
- Categories
- Search (AI-based)
- Chat system
- Seller flow
- Buyer flow

My honest take

You've now built:

👉 **A strong backend core**

👉 + **A financial/investment engine**

But your product is:

👉 **AI chat marketplace**

So next step is:

👉 **Marketplace layer — NOT more finance logic**

If you want next step, I can map:

👉 exact backend modules for **AI marketplace (listings + search + chat)**

👉 and how to integrate with what you already have

Just say 👍
