

sell sell marketplace updates:

SHAZ EJ

Use these one by one in Antigravity.

Prompt 1: Audit current search fields

Audit how SellSell currently stores and searches listing text.

Check:

- title**
- description**
- attributes JSON**
- aiDescription**
- searchable tags if any**
- Qdrant payload**
- search parser**
- query builder**
- ranking logic**

Do not modify code yet.

Report whether a buyer query like "I want a black Mercedes S400" can match a listing if Mercedes, S400, and Black are stored only as text.

Prompt 2: Add flexible text attribute support

Implement flexible text attribute search.

Goal:

All listing attributes should remain text-based and category-flexible.

Search must match buyer query terms against:

- title**
- description**
- attributes JSON text**
- aiDescription**

- category name
- seller-provided attribute text

Do not add new Prisma fields.

Do not create category-specific tables.

Do not reseed data.

Run typecheck after changes.

Prompt 3: Improve AI intent extraction

Improve intent extraction for natural buyer searches.

Example:

"I want a black Mercedes S400"

The system should extract:

- brand: Mercedes
- model: S400
- color: black
- category: vehicles

Also support Arabic and typo variations:

- مرسيدس
- اس 400
- S 400
- S400
- black
- أسود

Do not make the system rigid. Keep it text-first and flexible.

Run typecheck after changes.

Prompt 4: Improve seller text flow

Improve the seller flow for text-only listings.

When seller writes:

"Mercedes S400 black 2020 automatic petrol"

The system should create or prepare listing text attributes from the message:

- Mercedes**
- S400**
- Black**
- 2020**
- Automatic**
- Petrol**

These should be searchable as flexible text attributes.

Do not require fixed fields.

Do not change database schema.

Run typecheck after changes.

Prompt 5: Add search benchmark tests

Create or update a search benchmark script.

Test these queries:

- black Mercedes S400**
- white car**
- Toyota SUV**
- BMW under 20000**
- iPhone 15 Pro Max**
- apartment in Salmiya**
- sea view chalet**
- AC repair**
- driver job**

Each test should verify:

- correct category**
- correct top results**
- no unrelated category pollution**

- response does not hang
Run the benchmark locally.
Do not deploy.

Prompt 6: Fix ranking order

Improve result ranking.
For buyer query:
"black Mercedes S400"
Ranking priority should be:
1. exact model match S400
2. brand match Mercedes
3. color match black
4. category match vehicles
5. price/location relevance
The most accurate listing should appear first.
Keep search text-based.
Do not add new schema fields.
Run benchmark and typecheck.

Prompt 7: Final report only

Prepare a short report explaining what was changed.
Include:
- what files changed
- how text-based attributes now work
- how buyer search works
- benchmark results
- remaining risks
- whether it is safe to deploy
Do not deploy until I approve.
